

Year 5: Why do we have day and night?

Subject Specific Vocabulary			Sticky Knowledge about Earth and space	
orbit	An orbit is a repeating path that one celestial body takes around another.		<p>Important facts to know by the end of the Earth and space topic:</p> <ul style="list-style-type: none"> • Know about and explain the movement of the Earth and other planets relative to the Sun. • Know about and explain the movement of the Moon relative to the Earth. • Know and demonstrate how night and day are created. • Describe the Sun, Earth and Moon (using the term spherical). • Know information about the planets. • Neil Armstrong was the first man to step on the moon. 	<input type="checkbox"/> One million Earths could fit inside the sun – and the sun is considered an average-sized star.
solar system	The solar system is made of the eight planets that orbit our sun; it is also made of asteroids, moons, comets and lots more.	<input type="checkbox"/> An asteroid about the size of a car enters Earth's atmosphere roughly once a year – but it burns up before it reaches us.		
astronomical	Astronomy is the study of outer space, focusing on celestial bodies such as stars, comets, planets and galaxies.	<input type="checkbox"/> The sunset on Mars appears blue.		
planet	There are 8 planets in our solar system, they are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune.	<input type="checkbox"/> Earth is the third planet from the sun and the only world known to support an atmosphere with free oxygen, oceans of liquid water on the surface, and life.		
rotation	Rotation is when a shape is turned around a fixed point.	<input type="checkbox"/> There is no atmosphere in space, which means that sound has no medium or way to travel to be heard.		
spherical	Something spherical is like a sphere in being round, or more or less round, in three dimensions.	<input type="checkbox"/> Venus is the hottest planet in the solar system and has an average surface temperature of around 450° C.		
crescent moon	It is a slither of the moon that is lit up and can be seen. It is less than half the moon.	<input type="checkbox"/> The sheer size of space makes it impossible to accurately predict just how many stars exist.		
gibbous moon	The best way to describe a gibbous moon is that the moon is three-quarters lit up.			
eclipse	An eclipse occurs when an astronomical object is temporarily obscured. A lunar eclipse is when the Earth moves between the Sun and the Moon, therefore blocking the Sun's rays from striking the Moon.			
lunar	Is anything related to the moon.
